Pair Sum

Time limit: 1 sec

A very simple problem to explain. Given an array **A** of integers, your task is to find every pair of two elements **A[i]** and **A[j]** such that their summation equal to a given query value. There will be multiple query values. For each query, you have to identify if there exists such pair.

Input

- The first line of input contains two integers **N** $(1 \leq N \leq 100\,000)$ and **M** $(1 \leq M \leq 100)$ representing the number of element in the array and the number of query.
- The second line contains **N** integers representing the value in the array **A**. Each integer is non-negative that does not exceed 1,000,000.
- The third line contains **M** integers representing the queries. Each integer is non-negative that does not exceed 1,000,000.

Output

There must be exactly **M** lines. Each line contains a word "YES" or "NO" depends on if there exists a pair of elements of A the sum of which equal to each query respectively.

Example

Input	Output
4 5	YES
101 92 15 43	NO
193 194 192 58 59	NO
	YES
	NO
